Engage your community to increase African-American blood donations one family at a time!

If you have a loved one affected by sickle cell disease or thalassemia, you’ve probably been asked –

“How can I help?”

Tell your family, friends, and co-workers they can . . .

Donate Blood

It’s safe. It’s easy. It makes a difference!

DONATING blood saves lives!

YOU can make a difference!

Encourage your family and friends to donate blood today.
African-American Blood Donations Are Important

Blood is blood, right? No.

Blood from an African-American donor to an African-American recipient is more likely to match. This can mean fewer health problems for the recipient.

African-Americans can help people suffering from serious diseases, like sickle cell and thalassemia, by donating blood.

Less than 1% of all blood donations come from African-Americans.

Here’s What You Can Do!

Give blood.

Encourage others to donate by sharing your story.

Organize a blood drive. Make an announcement at neighborhood functions, church gatherings, work, or fraternity/sorority meetings.

Who Can Donate

To donate, you must be at least 16 years old, weigh at least 110 pounds, and be, generally, in good health.

Most people with diabetes or high blood pressure can donate blood.

If you couldn’t donate blood in the past because of low iron, you can try again! Try eating nutritious food and drink plenty of fluids before donating.

Giving Blood is Easy

Giving blood takes about an hour. You can expect to register; provide a confidential health history and have a mini-health exam; give blood; and eat a free snack.

There is no risk of catching a disease from donating blood.
