Employment-Based Coverage: <i>Firm Size of Family Head</i>	10
Age and Gender	12
Children in Georgia	13
Summary Findings	14

## Summary of Findings

Although the percent of uninsured Americans has increased each year, the absolute number of Americans with health insurance declined for the first time since the Census Bureau began collecting health insurance coverage information. Georgia and the nation as a whole saw a continued decrease in private coverage coupled with an increase in public coverage. Nationally, the number of uninsured Americans increased by more than four million, while in Georgia the number of uninsured increased by just fewer than 300,000 between 2008 and 2009. Compared to national estimates, a significantly larger proportion of Georgians lack any source of coverage. Twenty percent of all Georgians and over 22 percent of non-elderly Georgians lack coverage. Non-elderly Georgians are slightly less likely to have public coverage (20 versus 21 percent) than in the nation as a whole.

The recession significantly decreased employment and as a result hastened the decline of employment-based health insurance. Health care cost inflation has been eroding employer-sponsored coverage in Georgia throughout the decade. Since the year 2000, the likelihood of having employer-sponsored coverage in Georgia has fallen from more than 75 percent to less than 60 percent.

The fragility of the employer-sponsored health insurance market nationwide and in Georgia is leading to greater coverage through the public system for some populations, most notably for children. In addition, the share of the population lacking coverage is increasing for all groups, but some populations appear to be most at risk:

- Those in families with incomes between 100 and 200 percent of the federal poverty level,
- Those in families headed by workers at small firms, especially very small firms with fewer than 25 employees,
- Those in families headed by a part-time or part-year worker, and;
- Young adults ages 18 to 24.

These numbers reflect the effects of the recession, but they also continue a decade-long trend in coverage.

## Preface

The figures in this report are tabulations of the Annual Social and Economic Supplement to the Census Bureau's Current Population Survey (CPS). In March of each year the Census Bureau surveys approximately 89,000 families across the nation, receiving information on almost 210,000 individuals. One section of the survey solicits information on the source of health insurance coverage for each individual in the household, and since 1995 we have reported the results of those questions for Georgia.

There are a variety of sources of information regarding insurance coverage and each uses a different methodology to count the number of uninsured. The CPS is perhaps the most widely quoted source of information about insurance coverage nationwide and permits comparisons of the sources of coverage between states. An additional advantage of reporting from the CPS is that the annual nature of the survey provides estimates of change in coverage over time. A change in survey methodology in 2000 has made direct comparisons with survey results from years prior to that time difficult. This report contains some analysis of the trends in coverage over the past nine years and some discussion of the implications of those trends. Where trends are presented, we use a two-year moving average. This is consistent with the methodology recommended by the Census Bureau to smooth some of the variation that arises from the size of the sample in each year's survey.

In order to properly interpret the information that follows, please note the following:

- Respondents are asked about their health insurance coverage for the preceding year. It is possible for individuals to correctly state that they had several sources of coverage, so the percentages reported by insured category here may not total to 100.
- Based on a comparison with administrative records, the CPS consistently underreports the number of individuals enrolled in Medicaid.
- Most of the tables in this report exclude individuals aged 65 and over. These individuals are almost universally covered by Medicare.

# Health Insurance Coverage in Georgia and the United States

Compared to the nation as a whole, a significantly larger proportion of Georgians lacks any source of coverage. Twenty-one percent of all Georgians and 22.5 percent of non-elderly Georgians lack coverage. Nationwide, 17 percent of Americans and 19 percent of non-elderly Americans lack coverage. Levels of public coverage for the non-elderly in Georgia are slightly lower (20 versus 21.1 percent) than in the nation as a whole.

Source: Tabulations of the Annual Social and Economic Supplement to the Census Bureau's Current Population Survey, 2010

Note: The totals for insurance coverage categories may exceed 100% because individuals may have multiple sources of coverage.

Nationally, the number of uninsured Americans increased to 50 million, while in Georgia the number of uninsured increased to 1.96 million between 2008 and 2009.

Georgia and the nation as a whole saw a continued decrease in private coverage coupled with an increase in public coverage. The charts below use the two-year moving average to depict the change in private health insurance and in the uninsured since calendar year 2000 as measured by the CPS.

### Share of Population with Private Coverage: Georgia and the United States

The decline in private health insurance in Georgia of about 11 percentage points between 2000 and 2009 is mirrored by an increase in the percentage of Georgians without health insurance of more than six percentage points.

### Share of Population Uninsured: Georgia and the United States

## Sources of Coverage by State

Georgia ranks 5<sup>th</sup> in the share of its population lacking coverage and 5<sup>th</sup> in the number of individuals who are uninsured. There is a wide variation in the likelihood of being uninsured across states. Texas has the highest share of uninsured at 29 percent, while Massachusetts has the lowest share of uninsured at five percent.

Source: Tabulations of the Annual Social and Economic Supplement to the Census Bureau's Current Population Survey, 2010  
 Note: The totals for insurance coverage categories may exceed 100% because individuals may have multiple sources of coverage.

## Factors Affecting Sources of Health Insurance

One of the most important determinants of health insurance coverage is family income. Family income is expressed as a ratio of the federal government's poverty level in table 3. The poverty level is determined in part by the size of the family, so examining the sources of health insurance coverage by this ratio presents a clear picture of the relationship between a family's disposable income and health insurance coverage. It is important to note, however, that this does not adjust for local differences in the cost of living.

There is a clear, positive relationship between family income, as expressed as a percentage of the poverty level, and employment-based health insurance. Only one in six individuals living below poverty has employer-sponsored coverage, while 90 percent of those in families earning four times poverty or more have such insurance. Those individuals whose families have incomes just above or below the federal poverty level (FPL) are more likely to be uninsured than those with higher incomes. Forty-four percent of Georgians living in families with incomes below the poverty level receive public coverage while 41 percent of them are uninsured.

Source: Tabulations of the March 2010 supplement to the Census Bureau's Current Population Survey

Note: The totals for insurance coverage categories may exceed 100% because individuals may have multiple sources of coverage.

Over the last decade, Georgians with incomes below or near poverty were increasingly likely to be uninsured. The two-year moving average shows an increase of more than 15 percentage points in the share of individuals lacking coverage among near poor Georgians since 2000.

Of particular interest is the effect of the economy and unemployment on family income in Georgia. We note a significant decline in the share of families earning more than 300 percent of the federal poverty level. While only 48 percent of non-elderly Georgians earned at least this much in 2009, over two-thirds of Georgians had incomes above this level in 2008 (data not shown). This means that 1.6 million more Georgians fell into the lowest three income categories in 2009.

### Share of Georgia's Population Lacking Coverage by Family Income

(percentage of federal poverty level)

## Employment-Based Coverage: Work Status of Family Head<sup>1</sup>

The primary source of health insurance for Georgians remains employment-based plans. More than 91 percent of Georgians with private coverage obtain that insurance through an employment-based plan. However, the effects of the recession have significantly reduced employment-based coverage. Table 4 indicates that of those non-elderly Georgians who live in a family headed by a full-time, full-year worker, 69 percent have employment-based health insurance. That is down from 74 percent in 2008. That percentage falls to about 31 percent for those whose family heads experienced some unemployment during the year, and to just 17 percent for those families headed by a non-worker.

The number of Georgians in a family with a head of household reporting a spell of unemployment increased by more than 140,000 or 25% compared to last year (data not shown). This is more than the total growth in the non-elderly population in Georgia over the course of the year. The high likelihood that these individuals will be uninsured (almost 45%) is one of the drivers of the growth in the number of uninsured Georgians this year.

Families headed by non-workers are much more likely to have public health insurance coverage than other families in Georgia, accounting for 29 percent of all Georgians receiving public coverage, although they account for only 11 percent of non-elderly Georgians. The availability of public coverage for families headed by non-workers partially explains why they are slightly less likely to be uninsured than individuals in families headed by part-time workers or those experiencing some unemployment. While employment-based health plans are the source of most of the private health insurance coverage purchased in Georgia, 56 percent of the individuals without health insurance live in families headed by a full-time, full-year worker, and 84 percent of all uninsured individuals live in a family headed by someone with at least some attachment to the workforce.

<sup>1</sup> The family head is the individual in the family with the greatest earnings.

## Employment-Based Coverage: Firm Size of Family Head

One of the factors affecting the costs of health insurance is firm size. Smaller employers may face higher costs for providing health benefits than larger firms for three reasons. First, their small size means that they are less able to spread risks, resulting in premiums that are unpredictable. Second, their small size makes it harder for them to self-insure and avoid costly state mandates and taxes. Finally, they face higher administrative costs since they are less likely to have staff devoted to health benefits. Table 5 describes the differences in the sources of health insurance for individuals depending on the size of the family head's employer.

Less than half of non-elderly Georgians whose family head is employed by a firm with fewer than 25 employees has employment-based health benefits, while 72 percent of the individuals whose family's highest earner are employed by firms with more than 100 employees have employment-based coverage. While Georgians whose family head is working at firms with less than 25 employees make up 24 percent of the population, they comprise over 38 percent of those without coverage. Families whose head works for the smallest firms are more likely to be uninsured (38%) than Georgians in families whose head is a non-worker (31%). About half of Georgia's uninsured population lives in a family headed by a worker at a firm with fewer than 100 employees.

Note: The totals for insurance coverage categories may exceed 100% because individuals may have multiple sources of coverage.

The next chart shows the change in coverage by firm size of family head over the past nine years.

## Share of Georgians with Employer-Sponsored Insurance within Firm Size of Family Head

The likelihood of having employer-sponsored coverage fell for workers at large firms during the beginning of the decade but has been somewhat stable over the past five years. In contrast, the decline in the likelihood of having employer coverage for workers at small firms continues to decline and is now almost nine percentage points lower than at the start of the decade.

## Age and Gender

Other characteristics also play a role in an individual's demand for health insurance coverage. An individual's age and gender can also affect his or her source of health insurance coverage. Younger adults are likely to be healthier, less likely to perceive a need for health insurance, and less likely to be eligible for coverage as a dependent of a worker in their family. Women of childbearing years are more likely to use health care services than men of the same age. Women and children are more likely to be eligible for public coverage through Medicaid and the PeachCare program for children. These programs have been successful in providing increased coverage to Georgians. Table 6 examines the source of Georgian's health insurance by age and gender.

**Table 6**

Source: Tabulations of the March 2009 supplement to the Census Bureau's Current Population Survey

Note: The totals for insurance coverage categories may exceed 100% because individuals may have multiple sources of coverage.

Children ages 18 and under are the most likely among all Georgians to have public coverage and the least likely among all Georgians to be uninsured. There is little difference by gender among children. Among adults, men are more likely than women to lack coverage, while women are more likely than men to have public coverage. The chart below shows the trends in the probability of being uninsured within age groups.

## Share of Georgians Lacking Coverage within Age Groups

Among young adults, the decline in private coverage since 2000 is significant, and the sharp increase in the most recent year is startling, resulting in an increase in the uninsured rate of more than 13 percentage points. The increasing likelihood that adults are uninsured cuts across all age groups and is particularly troubling among those ages 45 to 64, the group most likely to require care among the non-elderly.

## Children in Georgia

While private coverage among children has declined in recent years, expansions of public coverage have prevented a comparable increase in the number of uninsured children in Georgia. The type of coverage Georgia's children have is highly related to their family's income. Children living in poverty or in families with incomes just above poverty have high rates of public coverage and limited private coverage.

About two-thirds of Georgia's uninsured children live in families with incomes at or below 200 percent of FPL. These children are generally eligible for either Medicaid or PeachCare.

## Summary Findings

The fragility of the employer-sponsored health insurance market nationwide and in Georgia was compounded during 2009 by rising unemployment and a sharp increase in the share of individuals living in families with incomes below 300 percent of poverty. These trends resulted in a sharp increase in the rate at which Georgians lack all sources of coverage. This is counteracted slightly by a continued trend to greater coverage through the public system for some populations, most notably for children. In addition, the share of the population lacking coverage is generally increasing, but some populations appear to be most at risk:

- Those in families with incomes between 100 and 200 percent of the federal poverty level,
- Those in families headed by workers at small firms, especially very small firms with fewer than 25 employees,
- Those in families headed by a non-worker, part-time worker, or part-year worker, and;
- Young adults ages 18 to 24.
